

AMENDMENT TO THE CLAIMS:

Please amend claim 2 as follows:

1. (Previously presented) An apparatus
which is configured to print each time one record carrier
to be printed,
which is configured to scan each time one record carrier
to be scanned,
which has holder means for holding a stack of record
carriers to be printed,
which has withdrawal means for withdrawing each time one
record carrier to be printed from the stack of record carriers
to be printed,
which has load-exerting means which are movable between a
load-exerting position and a no-load position and which in
their load-exerting position urge the stack held in the holder
means, in its area near the withdrawal means, towards the
withdrawal means under spring load and in their no-load
position assure that a stack of record carriers to be printed
can be introduced into the holder means without being
influenced by the load-exerting means and which has actuating
means for moving the load-exerting means from their load-
exerting position into their no-load position,
which has drive means for driving a record carrier to be
scanned, and
which has guide means for guiding a record carrier to be
scanned and to be fed to the drive means,
characterized in that
the actuating means for moving the load-exerting means
are, in addition, configured as guide means for guiding a
record carrier to be scanned and to be fed to the drive means.

2. (Currently amended) An apparatus as claimed in claim 1, characterized in that the actuating means are arranged so as to be pivotable about the pivotal axis, and the guide plate has at least two guide projections which each have a guide surface, the two guide surfaces being spaced at a distance from one another, which distance corresponds to the dimension of a record carrier to be printed in a direction parallel to the ~~pivotal~~ pivotal axis.
